Jython is the JVM implementation of the Python programming language. It is designed to run on the Java platform. A Jython program can import and use any Java class. Just as Java, Jython program compiles to bytecode. One of the main advantages is that a user interface designed in Python can use GUI elements of AWT, Swing or SWT Package.

Using Jython within Java Applications ¶ Often times, it is handy to have the ability to make use of Jython from within a Java application. Perhaps there is a class that would be better implemented in the Python syntax, such as a Javabean. Or maybe there is a handy piece of Jython code that would be useful within some Java logic.

Welcome to the Jython Wiki! The purpose of a programming language is to let software developers express their intentions as simply and directly as possible. - JimHugunin. Jython is a Java implementation of Python that combines expressive power with clarity. Jython is freely available for both commercial and non-commercial use and is distributed with source code.

Using jythonc A script called jythonc should have been installed in the Jython installation directory when you installed the package. If it was not, it can be invoked as follows: jython Tools\jythonc\jythonc.py. The jythonc tool generates actual Java source code, and then invokes a Java compiler over this source code to create the.class files.

You can use the Jython Evaluator processor to read, update, or create record header attributes. Use a map when creating or updating a header attribute. If a header attribute exists, the script updates the value. If it does not exist, the script creates the attribute and sets it to the specified value.

Jython has a known issue with the thread safety of imports. To work around this issue, you can use a system-wide lock available with the Jython Scripting origin to synchronize imports between threads and between pipelines. In your script, acquire the lock, import all needed modules, and then release the lock.
