Geosciences LibreTexts

Sedimentary Rocks  
What are clastic sediments? Clastic sediments are formed by loose particles of various sizes, which can evolve into sedimentary rocks such as sandstones, shales and conglomerates. They are essentially made up of sand, mud and gravel, formed from the weathering and erosion of pre-

Sedimentary rock - Wikipedia

Sandstone and other clastic sedimentary rocks differ from the igneous rocks in possessing a framework of grains which only touch each other but are not in a continuous contact because sandstone contains a network of pores which are at least partly filled with a mineral cement.
